

## **Audio Cable Connections One-Sheet**

## **Background**

- The UMix Music Player software plays two independent zones of mono audio not stereo.
- On the Audio Player application, these are called Zone A and Zone B. See the Audio Player image below.

## **Cables**

- A special cable is used to send the audio from your UMix Player to your amplifier. See the image below. You may <u>buy it here</u>.
- If you use two zones of music, the white end of the cable corresponds to Zone A and the red end corresponds to Zone B.
- If you use one zone of music, Zone A will be outputted to both ends of the cable simultaneously.
- One of these cables is shipped along with every Player system purchased from UMix.
